Players Are Searching While Courts Sit Empty

Today's booking experience fragments demand across chats, calls, screenshots and manual schedules.

Supply and Demand Fail to Meet at the Right Time

The missing layer coordinates schedule, location, price, quality and group readiness.

Not a coupon app. A coordination layer for expiring inventory.

Every Empty Court-Hour Is Revenue That Disappears

Occupancy matters only when the bookings are incremental and contribution-positive.

4,480

BUSINESS RULE

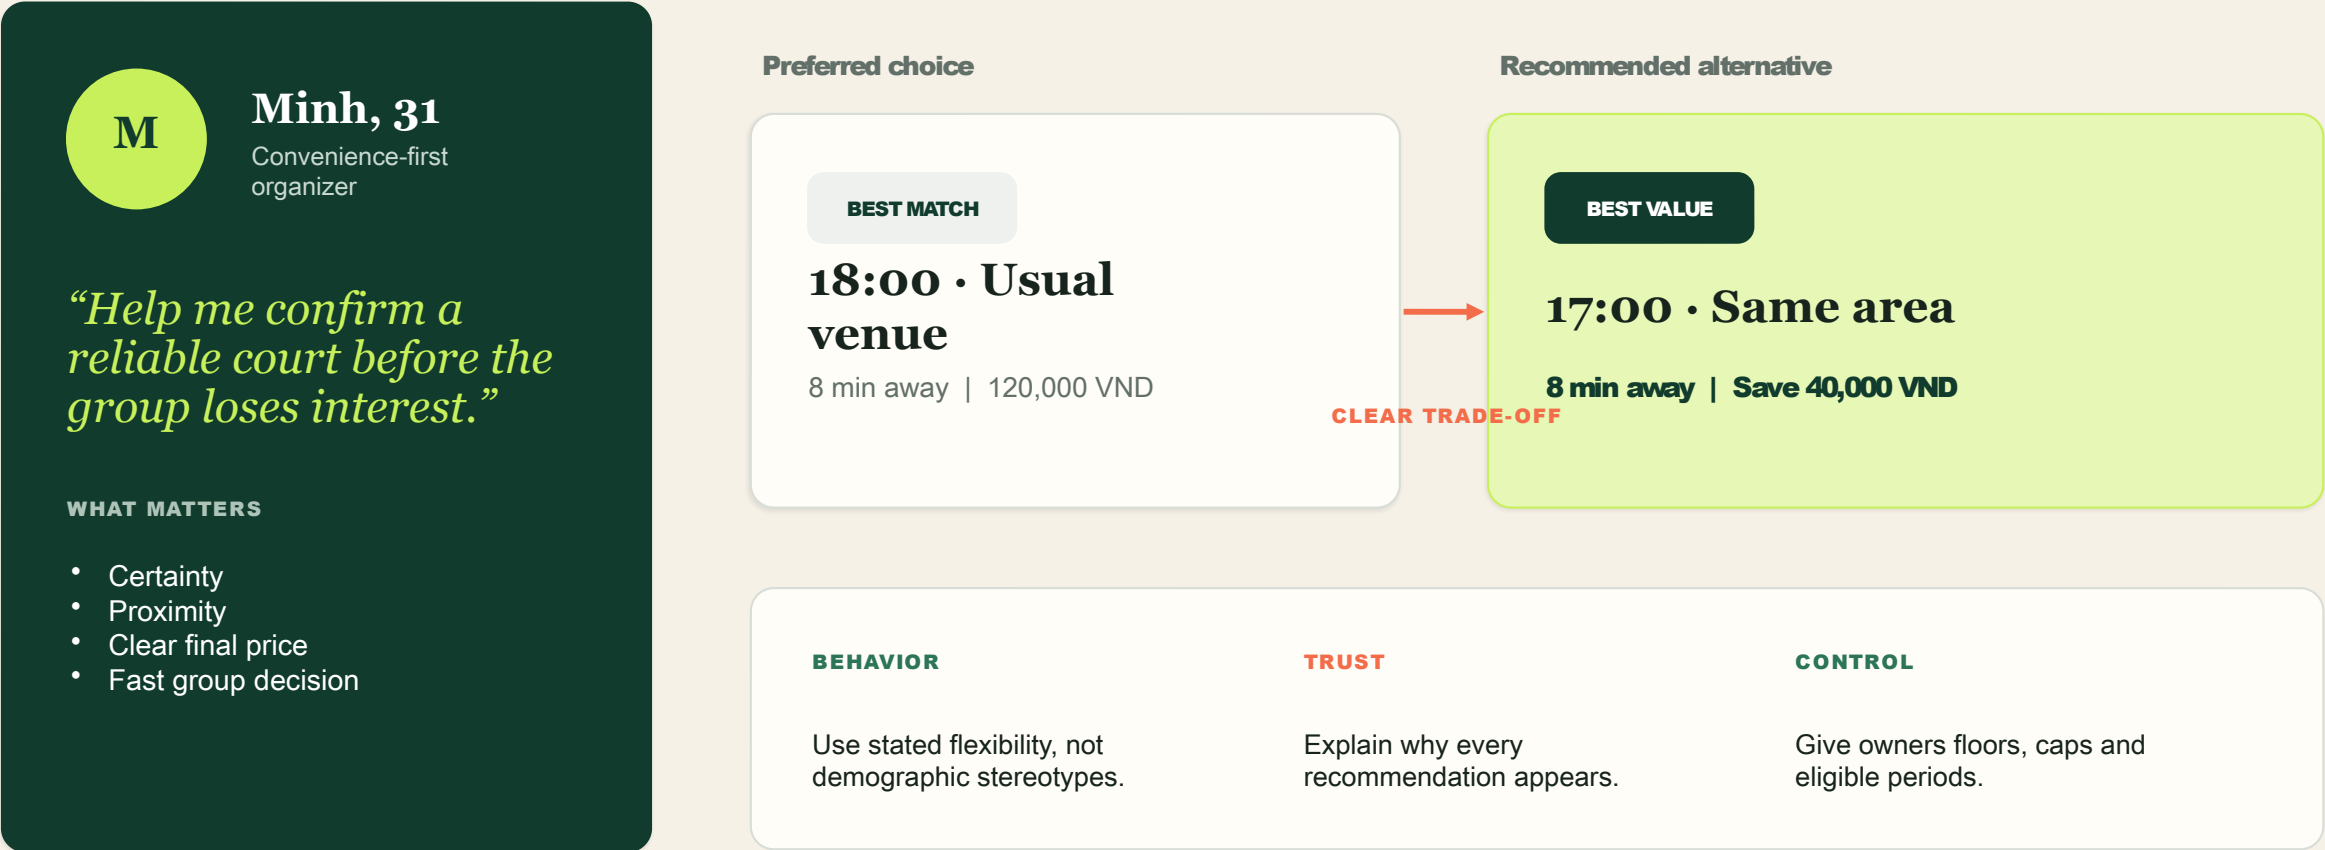

Maximize profitable occupancy

- Protect naturally full peak periods
- Create new off-peak demand
- Refill cancellations before expiry
- Measure contribution after incentives

Weekend demand after 16:00 is already modeled at 100%.

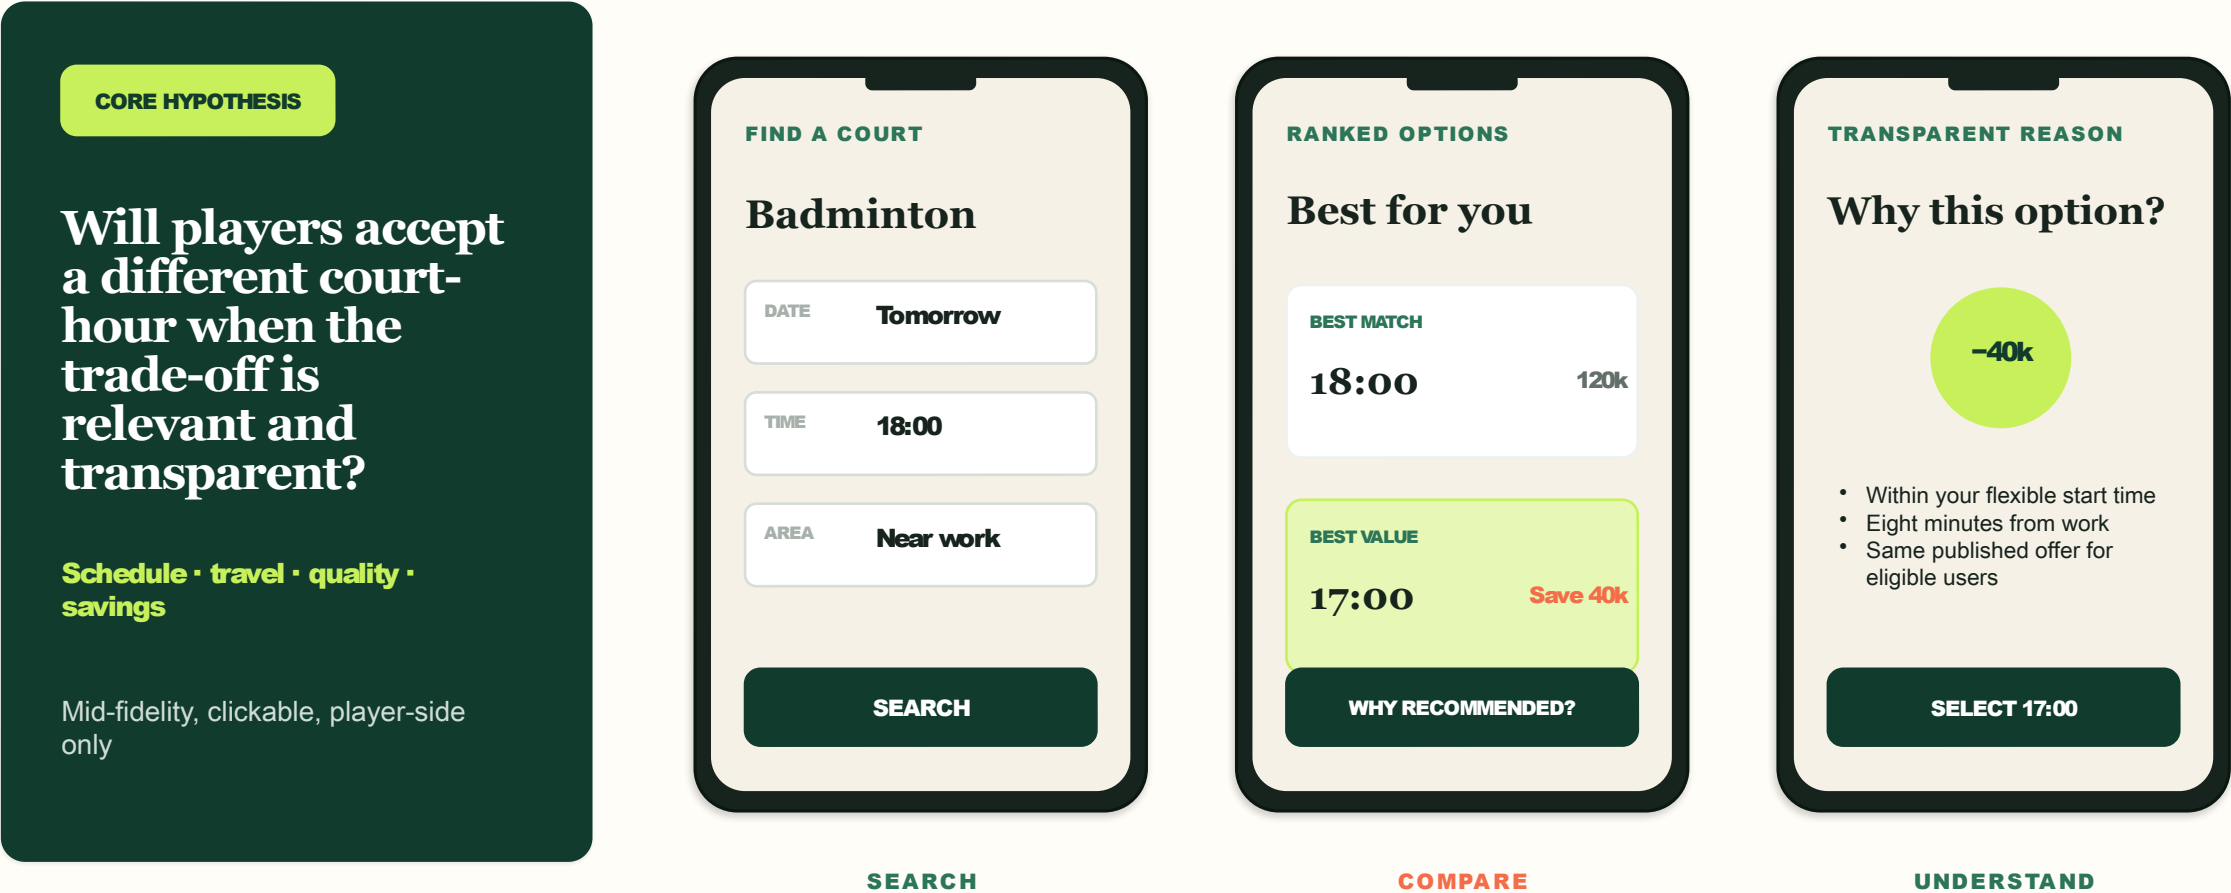

Flexibility Exists When the Trade-Off Is Clear

Players will shift demand when relevance, savings and trust outweigh the inconvenience.

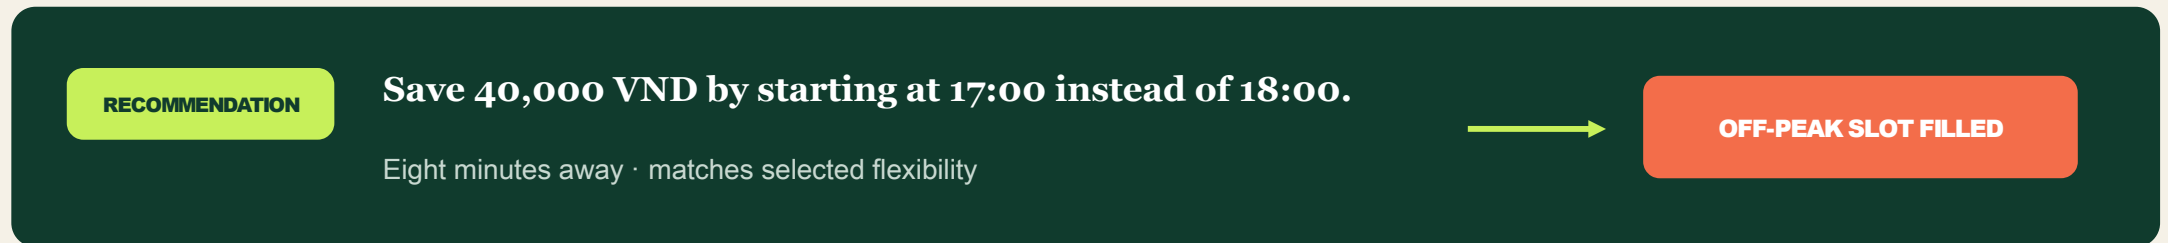

Test Whether Transparent Alternatives Can Shift Demand

A focused mobile prototype isolates the riskiest assumption before the full platform is built.

From Preferred Slot to Occupancy-Creating Alternative

Demo scenario: four players want badminton near work tomorrow at 18:00.

Validate Demand Shifting Before Building the Platform

A controlled prototype and venue pilot turn the occupancy thesis into measurable evidence.

PLAYER VALUE

- Find a suitable court in under 60 seconds
- See the final price and trade-off clearly
- Spend less time calling and coordinating

VENUE VALUE

- Lift incremental off-peak occupancy
- Refill cancelled inventory
- Protect peak price and contribution
